

Bayesian Optimization

Bayesian optimization in general can be used to optimize any black box function.

f_m , hold out
 \downarrow
 O LPS.

$f_m(OLD)$ \rightarrow Conditional on T_n data.

Manual Grid Search ($L(\gamma, c)$) \rightarrow AUC \rightarrow works for low-dimensional problems.

Contour plots of loss function

Does not scale well to higher Dimensions.

X (Big models on Big datasets).

Curse of Dimensionality.

\rightarrow more infeasible with higher dimensions

Random Grid Search

low value of AUC
so shldn't focus here.

high value of AUC,
so better to focus here.

* Steers your Algorithm to the region of better performance.

Sequential Model based Optimization Algorithms

↳ Bayesian Optimization.

Building some kind of Probability model for that loss function.

Build a Model of performance fn and sequentially try to move into the Region of better performance.

Building a probabilistic model over the loss surface

$f_m(\theta) \rightarrow$ if this takes 1hrs to evaluate on out-of-sample
Better to spend 2mins on updating your beliefs.

In Bayesian Optimization, we use something called Gaussian processes to actually model the model of a performance function.

Gaussian processes as a prior for performance functions we have.

Use Bayes Rule to update your posterior distribution

Gaussian Process

GPs are a generalization of GDs over functions

Specified by mean function, covariance fn.

G.P gives mean, variance of a normal distribution over the possible values of f at x .

Gaussian Distribution

Random Variables.

Specified by.
mean, variance

N/D gives Scalar no. back.

$$GP \rightarrow f_m(\theta)$$

You can build a normal distribution over the potential values of the performance function at that point

Where am i going to sample next?

Utility fns \rightarrow called Acquisition fns (in Bayesian context)
(Next best guess)

(Expected improvement Acquisition fn.)

Exploration vs Exploitation tradeoff. [Exploit a current region which is optimal & Explore a new region]

Tune the Algorithm which Tunes to Performance function

i.e GP's kernels are a H.P.

Use Pre-packaged model	&	Code it yourself
Bayesian Search CV		sklearn.gaussian-process.

\rightarrow Use log-uniform domain instead of uniform domain for H.P.s
 \rightarrow GP's kernel as H.P.

Production-ready modules for Bayesian optimization

- 1) Spearmint
- 2) Hyperopt
- 3) MOE
- 4) Hyperband (model free).
- 5) SMAC (model free)
